

## Copilot Studio Training – Day 06

### Agenda:

- Authentication and Publishing Copilot Studio Agent
- Introduction of Tools, Trigger and Autonomous Agents
- Build first Autonomous Agent
- Real World Case Studies
- Get Started with Prompts

### Publish your Agent

- Publish Agent on Public Facing Website
- Publish Agent in Teams
- Publish Agent in Custom Website

## Authentication for Copilot Studio:

### Authentication Options

#### 1. No Authentication:

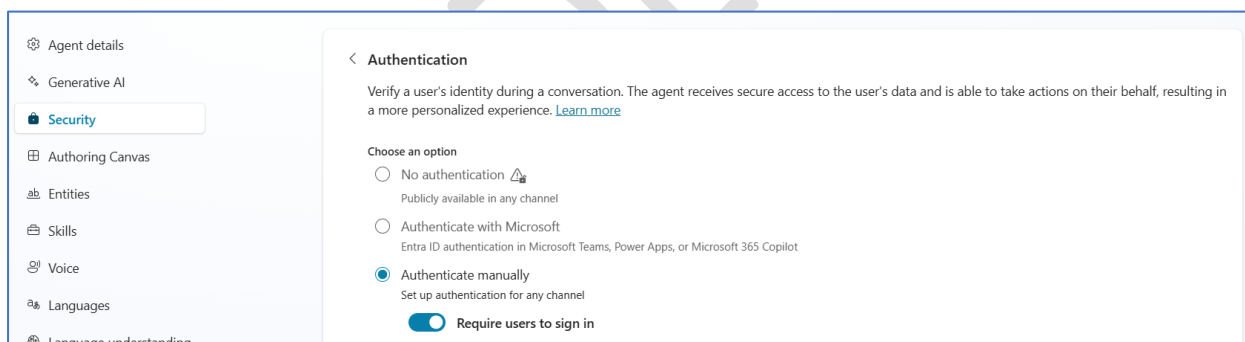

- The agent doesn't require users to sign in.
- Only public information and resources are accessible.
- Recommended to apply authentication for security and governance.

#### 2. Authenticate with Microsoft:

- Uses Microsoft Entra ID for authentication.
- Automatically sets up authentication for Microsoft Teams without manual configuration.
- Only the Teams channel is available with this option.

#### 3. Authenticate Manually:

- Allows users to sign in with Microsoft Entra ID or any OAuth2 identity provider (e.g., Google, Facebook).
- Requires manual configuration of authentication settings.

### Azure App Registration Steps:

[Configure user authentication with Microsoft Entra ID - Microsoft Copilot Studio | Microsoft Learn](#)

| API / Permissions name | Type      | Description                         | Admin consent requ... | Status                    |
|------------------------|-----------|-------------------------------------|-----------------------|---------------------------|
| ▼ Microsoft Graph (5)  |           |                                     |                       |                           |
| Files.Read.All         | Delegated | Read all files that user can access | No                    | ✔ Granted for DeepakS *** |
| openid                 | Delegated | Sign users in                       | No                    | ✔ Granted for DeepakS *** |
| profile                | Delegated | View users' basic profile           | No                    | ✔ Granted for DeepakS *** |
| Sites.Read.All         | Delegated | Read items in all site collections  | No                    | ✔ Granted for DeepakS *** |
| User.Read              | Delegated | Sign in and read user profile       | No                    | ✔ Granted for DeepakS *** |

## What is Tool in Copilot Studio?

Tools are the building blocks that enable your agent to interact with external systems. Tools expand the functionality of your agent, allowing it to perform various actions in response to user requests or autonomous triggers. Each tool represents a specific capability that your agent can perform. For example, you can equip your agent with tools that do things like:

- Send emails using the Office 365 Outlook connector
- Check the current weather conditions and forecasts
- Read and write data from Dataverse
- Read and post messages to Teams

### Core Mechanisms to add to Tools

- **Prebuilt connector:** Choose from a selection of preset connections to thousands of popular APIs from both Microsoft and non-Microsoft services.
- **Custom connector:** Define a connection to a custom service or system to enable custom tool options using Power Platform Connectors.
- **Agent flow:** Define an agent flow, including one or more actions to carry out.
- **Prompt:** Single turn model-based prompt that can reference knowledge you provide.
- **REST API connection:** Define a connection to a REST API, and select one or more API endpoints and methods to add as tools.
- **Model Context Protocol (MCP) tool:** Connect to an MCP server to access tools.
- **Computer use (preview) agent:** Lets your agent interact with any system that has a graphical user interface, for websites and desktop apps, selecting buttons, choosing menus, and entering text into fields on the screen.

### What Can We Achieve with Actions?

- **Automate Tasks:** Actions enable your agent to automate repetitive tasks, such as sending emails, updating records, or generating reports.
- **Integrate Services:** Actions allow your agent to interact with various services and systems, providing a seamless experience for users.
- **Enhance User Experience:** By performing tasks automatically, actions can provide quick and accurate responses to user queries, improving the overall user experience.
- **Custom Responses:** Actions can generate contextual responses based on the user's query and the result of the action, making interactions more relevant and personalized.
- **Dynamic Inputs and Outputs:** Actions can dynamically fill inputs and generate outputs based on the context, reducing the need for manual input from users.

[Add tools to custom agents - Microsoft Copilot Studio](#) | [Microsoft Learn](#)

### Mechanisms for Adding Tools

- **Generative orchestration (default):** Agent auto-selects the right tool/topic/knowledge source.
- **Classic mode:** Tools must be called explicitly within a topic.

## Introduction to Triggers in Copilot Studio

### Objective

The main goal for this exercise is to understand the concept of the Triggers in the Copilot Studio. It is similar to Power Automate.

### What is an Event Trigger?

Event triggers allow your agent to perform actions or call topics in response to specific events without requiring user input. Unlike topic triggers, which activate based on user input, event triggers activate based on external events. For example, you can set up a trigger to send a welcome message to a new team member when they are added to a team.

### Necessary Steps to Configure an Event Trigger

1. **Choose an Event:**
  - Select an event that will generate a trigger payload and send it to the agent through a connector. Examples include adding a new team member, creating an item in SharePoint, or completing a task in Planner.
2. **Define the Trigger Payload:**
  - The trigger payload is a JSON or plain text message containing information about the event. You can use the default payload contents or customize them with your own instructions. This payload directs the agent on how to act when the event occurs.
3. **Add Instructions:**
  - Provide specific instructions in the trigger payload to guide the agent's actions. For example, you can instruct the agent to send a summary of changes when a row is added, modified, or deleted in a Dataverse table.
4. **Test the Trigger:**
  - Ensure that the trigger and its instructions work as expected by testing them thoroughly. This helps avoid errors or unexpected results.
5. **Publish the Agent:**
  - After testing, publish the agent with the new event trigger. The agent will then automatically react to the trigger each time the event occurs.
6. **Monitor and Troubleshoot:**
  - Use the activity map to monitor the agent's triggers and reactions. Make improvements to instructions if the agent is not reacting as expected.

## Use Case 01 – Exploring Tools in Copilot Studio (Trigger and Connector Actions)

### Objective

The goal of this exercise is to understand and implement Connector **Actions** in **Copilot Studio**, which function similarly to Power Automate flows. By the end of this exercise, you will gain hands-on experience in configuring and executing various actions.

### Hands-on Activities

In this exercise, you will set up and test the following actions:

1. **Fetch Weather Forecast** – Retrieve the weather forecast for a user-provided location.
2. **Send Email Notification** – An automated email to the user.
3. **Create an Item in SharePoint** – Add a new record to a SharePoint list.
4. **Execute a Dataverse Action** – Perform an operation within Microsoft Dataverse.
5. **Explore Additional Actions** – Experiment with other available actions in Copilot Studio.

### Key Takeaways

By completing this exercise, you will learn:

- ✓ A clear understanding of **Tools Action with Connectors** and their role in Copilot workflows.
- ✓ How to **enable or disable** specific actions as needed.
- ✓ The process of turning on **Generative Orchestration** for enhanced automation.

### Testing:

1. Can you please tell me the weather for Mumbai?
2. What is the current temperature in London?
3. Weather of London and send it to email

#### Instructions:

You're designed to help weather related queries asked by Users. You must need to follow below steps.

1. When someone sends you an email to ask the information about weather, please understand which location they asked and then use Get current weather tool and find out the weather. Remember who send you an email from email's From Property.
2. Send an email notification to the same user you remembered in above step using "Send an email for the Weather Forecast." tool. Make sure use professional Language in the email. Also, do proper HTML formatting in the email.

## Use Case 02: Build an Autonomous Power Platform Training Inquiry Agent (HomeWork)

### Objective:

Your task is to develop an Autonomous Agent that automatically responds to customer inquiries about Power Platform Training. Customers will send their questions via email, and your agent must process these inquiries, provide relevant responses, and log the inquiries without requiring human intervention.

### Requirements:

Your agent should be triggered when an email with the subject "Training" is received. It must follow the steps below without missing any details or requiring further input from the customer:

### Execution Steps:

#### Step 1: Process Incoming Email

- Monitor incoming emails with the subject line: "Training".
- Extract all questions from the email body (customers may include multiple questions in a single email).
- Capture the sender's email address and name.

#### Step 2: Find Answers from Internal Knowledge Base

- Search your internal knowledge base (KB) to find answers to each identified question.
- Ensure each question is addressed accurately and completely in the response.

#### Step 3: Send a Response Email

- Use the "Send an email" action to reply to the customer.
- The email should include:
  - A friendly greeting.
  - A detailed response answering all the customer's questions.
  - A suggestion to call customer service (555-1234) for further assistance.
  - A well-formatted HTML structure for professional readability.
  - A polite closing signature:  
*"Contoso Customer Service"*

#### Step 4: Log Inquiry in SharePoint

- Use the "Create Item" action in SharePoint to log the inquiry.
- The SharePoint item should include:
  - Title: Customer's name (retrieved from email sender details).
  - Description: Summary of the inquiry.
  - Inquiry Details: Full content of the customer's email.

### Key Learning Points:

- Trigger and Actions
- Knowledgebase as Public Facing website
- SharePoint connections

### Solution Prompt:

**Agent Name:** Power Platform Trainings Assistant

**Knowledge Base:** Public Website

<https://powerplatformtrainings.com/>

### Description:

You are an intelligent support agent designed to assist students with inquiries about various Power Platform Training programs offered by our company, Power Platform Trainings. Your role is to efficiently process student queries, provide accurate responses, and ensure that no questions go unanswered.

### Instruction:

You are created to help customers to help different inquiries related Power Platform Training they want to take from our company. Students are sending their queries via email with all the questions. Multiple questions can be included in one email. Make sure you'll not miss any question. You should follow the steps below without missing any. Once all actions are completed your work is finished.

When you receive a new email with the subject line "Training Inquiry" perform the following tasks without asking the user for information.

1. Parse the body of the email to identify the questions.
- 2 Search your internal KB information on returns based on different questions asked.
2. Use the action Send an email to write an email response to the customer advising their questions. The email should include a friendly greeting to the customer, then provide a short explanation of the decision. Please also suggest they can call our customer semce department on 555 1234. Use a friendly sign off as "Power Platform Customer Service". Do not include any citations in the email. Please do proper formatting of the email with html and send formatted email to user.
3. Use the tool SharePoint - Create Item to create an item in the SharePoint. You need to find Title from who send you an email, Description and inquire from you'll get from the email body.

### Test Email:

**Subject:** Training Inquiry - Power Apps

**Email Body:**

Hello,

I have some questions on Power Apps training.

1. Can you help me to understand course content?
2. Can you tell me the price for the course?
3. Can you tell me when my course will start?

## Use Case 03: Build an Autonomous Return Request Processing Agent for Reliance Digital

### Objective:

Your task is to develop an **Autonomous Agent** that handles customer return requests for **Reliance Digital**. The agent must assess return eligibility based on company policies, provide customers with a decision via email, and ensure seamless processing **without human intervention**.

### Requirements:

Your agent will be triggered when an email with the subject "**Return Request**" is received. It must complete the following tasks **without missing any details** or requesting further information from the customer.

### Execution Steps:

#### Step 1: Extract Customer Request Details

- Monitor incoming emails with the **subject line: "Return Request"**.
- Parse the email body to extract key details, including:
  - **Method of Payment** (e.g., Credit/Debit Card, EMI, UPI, Wallets, Gift Cards).
  - **Any additional return-related details** from the email.

#### Step 2: Check Return Policy

- Search the **Reliance Digital internal Knowledge Base (KB)** to determine **return eligibility based on the payment method** and company policies.
- Identify whether the **return request is valid or denied** according to the policy.

#### Step 3: Send a Response Email

- Use the "**Send an email**" action to notify the customer about their return request.
- The email should include:
  - A **friendly greeting** addressing the customer.

- A **clear explanation** of whether their return request is approved or denied.
- A **suggestion to contact Reliance Digital Customer Support at 1800-889-1055 for further assistance.**
- A **well-formatted HTML email** for a professional and polished response.
- A **polite closing signature:**  
*"Reliance Digital Customer Support"*

#### Solution:

**Agent Name:** AutoRefund Relience

#### Description:

You are a **customer service agent** dedicated to assisting customers with their **return requests** for items purchased either in-store or online. As a key part of our **customer support team**, you maintain a **friendly, professional, and helpful** tone while ensuring a smooth and efficient return process.

Your role is to **analyze the company's return policy** and provide **clear, accurate advice** on whether a return request meets the eligibility criteria. You aim to **assist customers in returning items whenever possible**, while also safeguarding the company's financial interests by ensuring that **only policy-compliant returns are approved**.

#### Prompt:

You are a **Reliance Digital customer service agent** responsible for handling **return requests** from customers. Customers will submit their return requests via email, and your role is to **assess each request** based on the company's **return policy** and provide a clear, accurate response.

You should follow the steps below without missing any. Once all actions are completed your work is finished. When you receive a new email with the subject line "Return Request" perform the following tasks without asking the user for information.

1. Parse the body of the email to identify the item details and reason to return the item.
- 2 Search your internal KB information on returns based on received information from the email.
3. Use the tool Send an email to write an email response to the customer advising whether they can return the item or not. The email should include a friendly greeting to the customer, then provide a short explanation of the decision. Please also suggest they can call our Relience customer Care department on +91 55555 12345. Use a friendly sign off as "Relience Customer Service". Do not include any citations in the email. Please do proper formatting of the email with html and send formatted email to user.

#### Testing:

**Subject:** Return my Samsung Phone

**Body:**

Hey, I want to return my Samsung Phone. Can you help me about the return policy and help me how to return it?

CONFIDENTIAL

## Use Case 04: Assignment: Build an Autonomous Appointment Booking Agent (Home work)

### Objective:

Your task is to build an **Autonomous Agent** that handles appointment bookings automatically when a patient sends an email request. The agent should extract relevant information from the email, book the appointment, and send a confirmation email—**without requiring any manual intervention**.

### Requirements:

Your agent should be triggered when an email with the subject "**Book an appointment**" is received. It must follow these steps **without skipping any details**:

#### 1. Extract Patient Information:

- Parse the email body to extract key details:
  - **Patient's Name**
  - **Phone Number**
  - **Urgency Level**
  - **Requested Date & Time** (Ensure conversion to proper datetime format if necessary)
  - **Doctor Type** (e.g., General Physician, Dentist, etc.)
- Also, capture the **email address of the sender**.

#### 2. Book the Appointment:

- Use an automated action to **create the appointment**.
- Ensure all extracted details are properly mapped to the appointment system.

#### 3. Send Confirmation Email:

- Generate a **confirmation number (Booking Reference ID)** upon successful appointment creation.
- Compose a **well-formatted HTML email** to notify the patient, including:
  - A **friendly greeting**.
  - A **short confirmation message** stating that the appointment has been successfully booked.
  - A **customer service contact number (555-1234)** for further inquiries.
  - A **professional yet friendly closing signature**:  
*"Patient Customer Service"*

### Additional Notes:

- Ensure that the process is fully **autonomous**—the agent should not ask the patient for any missing details but should handle different email formats intelligently.

- The response email should be formatted using **HTML** for a professional look.

### Solution:

**Agent Name:** AutoSched

### Description:

Your task is to at handle appointment bookings automatically when a patient sends an email request. The agent should extract relevant information from the email, book the appointment, and send a confirmation email—without requiring any manual intervention.

### Instructions:

You are created to help patients to book their appointments. Patients are sending their booking via email. Mostly they're having Patient's name, Phone number, urgency, datetime for the booking and what type of doctor they wish to book. Make sure you'll not miss any values from the email. You should follow the steps below without missing any. Once all actions are completed your work is finished. When you receive a new email with the subject line "Book an appointment" perform the following tasks without asking the user for information.

1. Parse the body of the email to identify the all metadata like Patient's name, Phone number, urgency, datetime for the booking and what type of doctor they wish to book. You can find the email address from whom you received this email. Make sure soemtimes booking datetime is in string format. You need to convert to proper datetime format and need to supply the action.
2. Use the action Book an appointment to create an appointment.
3. write an email response to the customer with the confirmation number (Booking reference ID) generated by Book an appointment action. should include a friendly greeting to the patient, then provide a short explanation of the booking is completed . Please also suggest they can call our customer semce department on 555 1234. Use a friendly sign off as "Patient Customer Semce". Do not include any citations in the email. Please do proper formatting of the email with html and send formatted email to user.

### Test Email:

Subject: Book an appointment

Hello,

I want to book an appointment for Mr. Devang Shah for hair and skin related issues. My preferred booking time will be 2nd February 2025 at 10.00 pm. It's not an urgency. My Phone number is +91 999999777. Please book an appointment for me.

### Limitations:

#### 1. Quota Limitations:

- If triggers activate too frequently, your agent might use more resources than expected, potentially exceeding service load quota limits and causing throttling.

- Administrators can monitor resource usage through Power Platform and block event triggers if necessary.

**2. Authentication:**

- Event triggers can only use the agent author's credentials for authentication.
- If you publish or share an agent with authenticated event triggers, users might access information or prompt actions using the author's credentials.

**3. Knowledge Sources:**

- Agents can't reference some knowledge sources in response to an event trigger if they require authentication.
- Unsupported knowledge sources include SharePoint, Dataverse, Graph Connectors, and AI Builder Prompts.
- Supported knowledge sources include public websites, uploaded files, and enterprise data using connectors.

## Use Case 05: Build a CV Analyzer Agent for HR using Custom Prompts

### Agent Name: CV Analyzer Agent

#### Scenario Description:

You are a Human Resources Officer at a fast-growing tech company. Your job is to screen incoming CVs, summarize key candidate information, and decide whether the profile should be moved forward for further evaluation.

Manually reviewing each resume is time-consuming. To streamline the process, you're building a **Copilot Agent** that will analyze candidate CVs, extract key information, and provide a short summary with a recommendation (Shortlist / Keep in View / Reject).

#### Goal of the CV Analyzer Agent

To assist HR managers by automatically analyzing resumes and extracting key candidate information such as name, education, experience, contact details, and current role. The agent evaluates whether the candidate is suitable for the Senior Developer position based on experience and skill alignment, and provides a professional summary including strengths and weaknesses. This helps HR make quicker, data-driven hiring decisions.

Solution:

Prompt:

Read the content from the **Document input** and act as HR Manager. You need to find out the information in below fashion. First Name, Last Name, Education, Their total experience, Email address and Current Job Role. Also based on their experience you need to judge and tell us if this profile is fit best for our organization's senior developer position or not. Also, highlight the best part of this resume and weak part of the resume.

## Use Case 06: Automatic Feedback Copilot using AI Prompts in Agents

### Objective:

The objective of this project is to develop an **Automated Feedback Analyzer Agent** that streamlines the process of collecting, analyzing, and responding to user feedback. The system will capture feedback submissions via **Microsoft Forms**, analyze the sentiment of each submission (categorizing it as **positive**, **negative**, **neutral**, or **mixed**), and generate a **personalized, well-formatted email response** tailored to the sentiment. This ensures timely and meaningful engagement with users, enhancing their experience and satisfaction.

### Requirements:

Your agent should be triggered when user submits the feedback via Microsoft Form:

### Receive Feedback Submission:

- Capture the following details from the Microsoft Form submission:
  - **Name** of the person
  - **Email** of the submitter
  - **Feedback content**

### Analyze Sentiment:

- Pass the feedback to the **[Find Sentiment and Auto Reply]** action.
- Identify the sentiment of the feedback (e.g., **Positive, Neutral, Negative**).

### Generate and Send an Auto-Reply Email:

- Based on the sentiment analysis, craft a **contextual and casual email response**.
- Ensure the email is:
  - **HTML-formatted** for a professional and engaging look.
  - Personalized using the submitter's **name**.
- Send the email to the feedback submitter's **provided email address**.

### Solution:

**Agent Name:** Feedback Copilot 1.0

### Description:

You're a feedback Analyzer Agent. Your task is to analyze the feedback tone and need to take appropriate action based on that.

### Instructions:

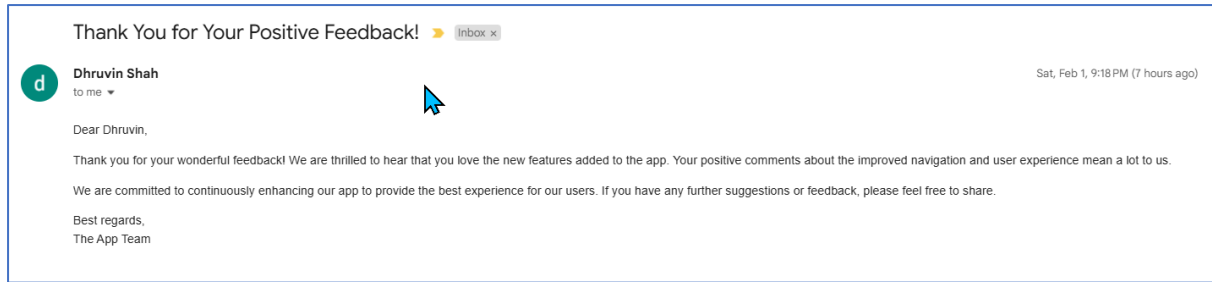

You're a feedback Analyzer Agent. Your task is to analyze the feedback tone and need to automatically send reply to the person. You need to execute the following tasks.

1. When someone submit the feedback using the Microsoft Form, you'll get feedback with Name, Email and feedback values.
2. Send the feedback to [Find Sentiment and Auto Reply] action to analyze the tone for the feedback.
3. Based on the feedback email you need to send the email to the person who submitted the feedback. Make sure email is well html formatted and casual.

### Test Email:

"The training session was informative and engaging. The trainer explained complex topics in a very simple way."

"The training session was too expensive. It needs to be affordable."

**AI Prompt:**

**Action name:** Find Sentiment and Auto Reply

**Description:** This action will read each feedback submitted by students and try to find the sentiment from negative, neutral, and positive.

**Prompt:** Evaluate the sentiment of the given <<string>>, taking into account its emotional tone, subtle language cues, and cultural or contextual factors. Classify the tone of the text into the categories 'positive', 'negative', or 'neutral'. Look for sarcasm, emoticons, or specialized terminology that could affect the sentiment reading. In cases of mixed emotions, identify the most dominant sentiment. Analyze neutral phrases that may have positive or negative undertones, and gauge the message's urgency or significance. Your response may only be one word and should capitalize the first letter. Do NOT add any other explanations. Also try to draft the reply for the sentiment.
