

Copilot Studio Training – Day 08

Agenda:

- Agent Flow in Copilot Studio
- How Agent Flow is different than Copilot Studio?
- How Licensing in the Agent Flow works?
- Some new Actions for the Agent Flow
- How to Change License Model for Existing Power Automate to Agent Flow?

What is an Agent Flow?

- An **Agent Flow** is a **rule-based intelligent automation** tool within Microsoft Copilot Studio.
- Enables **workflow orchestration** across multiple services.
- Supports **manual, scheduled, or event/agent-based triggers**.
- Perfect for building **AI-driven assistants** and automated responses.

Feature	Agent Flow (Copilot Studio)	Cloud Flow (Power Automate)
Licensing	Uses Copilot Studio capacity	Requires Power Automate license
Interface	Copilot Studio Designer	Power Automate Interface
Targeted Usage	Intelligent automation, Agents	General workflow automation
Triggers	Manual, Event, Agent-based	Manual, Scheduled, Automated
AI integration	Native support (AI prompt, GPT)	Requires separate setup

Licensing Requirements

- **Agent Flows run on Copilot Studio capacity-based licensing**, not per-user licenses.
- You **must allocate capacity** to your environment:
 - Go to **Power Platform Admin Center**
 - Navigate to **Licensing > Copilot Studio**
 - Assign message capacity (e.g., 5,000 out of 25,000)

[Billing rates and management - Microsoft Copilot Studio | Microsoft Learn](#)

 Collapse table

Copilot Studio feature	Billing rate	Use in Microsoft 365 Copilot scenarios ¹	Autonomous triggers ²
Classic answer	1 message	No charge	N/A
Generative answer	2 messages	No charge	2 messages
Agent action	5 messages	No charge	5 messages
Tenant graph grounding for messages	10 messages	No charge	10 messages
Agent flow actions per 100 actions	13 messages	13 messages	13 messages
AI tools			
- Text and generative AI tools (basic) per 10 response	1 message	1 message	1 message
- Text and generative AI tools (standard) per 10 response	15 messages	15 messages	15 messages
- Text and generative AI tools (premium) per 10 response	100 messages	100 messages	100 messages

Benefits of Agent Flows

- Unified automation experience in Copilot Studio.
- Cost-effective (uses consumption-based capacity).
- Supports **AI-powered actions and prompts**.
- Simplified no-code interface for building intelligent flows.
- **End-to-end visibility**, history, and analytics.

Practical Case Study 01 – Compare Power Automate and Agent Flow Side by Side

Use Case 02: Build a Schedule Agent to send daily Tasks to Users

Objective:

Your task is to develop an **Autonomous daily scheduler** that handles sends the due task from SharePoint List to users every day without **human interaction**.

Solution:

Agent Name: Daily Schedule Agent

Instructions:

You are Daily Scheduler Agent.

1. You'll get tasks due via Recurring Agent. You need to analyze tasks due in next 2 days and group them by whom it assigned to.
2. You need to use Send an Email action to send the tasks to each individual one. Make sure that you don't miss anyone. Email should be well formatted HTML.

Practical Case Study 03 - Case Study: AI-Powered High Priority Medical Equipment Approval

Organization Background

A multi-specialty hospital manages frequent internal requests for purchasing medical equipment.

Requests range from:

- Emergency ICU devices
- Diagnostic equipment
- Routine operational supplies

Previously, all requests were manually reviewed by department heads and procurement, causing:

- Delays in emergency equipment approvals
- Unnecessary escalation of low-priority items
- Lack of consistent urgency classification
- Administrative overload

The hospital wanted to:

- ✓ Automatically identify high-priority equipment
 - ✓ Escalate expensive purchases
 - ✓ Reduce manual workload
 - ✓ Maintain governance for critical decisions
-

Business Objective

Automate the internal equipment request process using:

- Model-Driven App (request submission)
- Dataverse (request storage)
- Copilot Studio Agent Flow
- AI-powered approval stage
- Multi-stage human approvals

Request Form Fields

Medical staff submit requests with:

- Requester Name
- Urgency Level (High / Medium / Low – optional/manual)
- Estimated Cost
- Reason for Request
- Criticality Description (free text)

AI-Powered Decision Stage

The first gate in the approval workflow is an **AI Stage**.

AI receives:

- Urgency parameter
- Estimated Cost
- Free-text justification
- Criticality description

AI applies the following rules:

High Priority Definition:

- Life-saving or emergency equipment
- ICU / ER / trauma / cardiac usage

- Immediate risk to patient safety

AI Decision Logic:

AI chooses **Approved** if:

1. Urgency Level = High
OR
2. Description indicates emergency / life-saving need
OR
3. Estimated Cost $\geq$ \$5,000

Otherwise → **Rejected**

Workflow Architecture

Medical Staff submits request

AI Stage evaluates High Priority

If Approved (High Priority)

→ Department Head Approval

→ Admin Approval

→ Update Dataverse + Log to SharePoint + Notify

If Rejected (Not High Priority)

→ End process or simple route

→ Update Dataverse

Solution:

You are responsible for reviewing internal medical equipment purchase requests.

Your task is to decide whether this request should be treated as High Priority.

Inputs:

Urgency Level: {strUrgency}

Estimated Cost: {numEstimatedCost}

Reason for Request: {strReason}

Criticality Description: {strCriticalityDescription}

Definition of High Priority:

- Life-saving or emergency equipment required immediately to prevent serious harm or death.
- Equipment needed in ICU, ER, trauma, cardiac, or emergency response.
- Equipment necessary to handle a critical patient situation.

Definition of Not High Priority:

- Routine, support, or operational equipment.
- Diagnostic or administrative equipment that is not urgently life-saving.
- Requests that can wait without immediate risk to patient safety.

Decision Rules:

1. If Urgency Level equals "High" (case-insensitive), choose Approved.
2. If the Reason for Request or Criticality Description clearly matches the Definition of High Priority, choose Approved.
3. If Estimated Cost is greater than or equal to 5000, choose Approved.
4. Otherwise, choose Rejected.

Important:

- Choose Approved if ANY of the above High Priority conditions are met.
- Otherwise choose Rejected.
- Return only the decision (Approved or Rejected).
- Do not provide explanations or additional text.
- Base your decision only on the provided inputs.

Testing

Case 1 – Defibrillator for ER

Urgency: Medium

Cost: \$8,500

Description: "Needed for emergency cardiac response"

AI Decision:

- ☒ Approved (Cost + description indicate High Priority)

Routing:

Department Head → Admin → Approved

Case 2 – Ventilator for ICU

Urgency: High

Cost: \$4,200

AI Decision:

- ☒ Approved (Urgency = High)

Routing:

Department Head

Case 3 – Patient Monitor Cart

Urgency: Low

Cost: \$1,200

Description: "Additional storage cart for ward"

AI Decision:

✗ Rejected (Not high priority, cost below threshold)

Routing:

Ends without escalation
