

Copilot Studio Training – Day 12

Agenda:

- DLP in Copilot Studio
- Access Copilot Logs using Microsoft Purview
- Deployment for Copilot studio Agent
- Embed Copilot Studio Agents in Model Driven Applications

Data Loss Prevention (DLP) in Microsoft Co-Pilot Studio

What is Data Loss Prevention (DLP)?

- **DLP** enforces policies to prevent unauthorized access to data or services.
- It is used to protect sensitive data from being accidentally leaked to external or internal actors.
- DLP can prevent oversharing of data and ensure that only authorized users can access specific resources.

Key Scenarios for DLP in Co-Pilot Studio

- **Scenario:** Co-pilot accesses knowledge sources (e.g., SharePoint, OneDrive) and you want to protect these sources from unauthorized access.
- **Example:** If a developer accidentally points to an internal SharePoint resource, DLP can block access to that resource.

How DLP Works in Power Platform

- DLP is implemented by creating policies and applying them across environments to Power Platform connectors.
- DLP policies can be applied to Power Apps, Power Automate, and other Power Platform applications.
- **Purpose:** Protect sensitive data, prevent oversharing, and block unauthorized access.
